## BED HEAD UNITS

## BED HEAD UNITS

Patient bedhead units are mainly supportive units offering an alternative solution to the installation of medical gas system outlets on the wall. Depending on the specific requirements of the site of utilization, electrical outlets and equipotential nodes in that site, plus - if desired - connections to other services that may be necessary for the patient's care and comfort on a single unit, in harmony with the room's decoration.

The bed head units; can be fitted with indirect lamps for room illumination, direct lighting fixture at a certain angle allows the light to disperse over the head of the patient and provide excellent illumination for reading, while positioning of the indirect lighting efficiently disperses light over the wall above the unit. All lamps can be fitted with an electronic starter that prevents delays when turning the lamps on.

The bedhead units may be manufactured in various different dimensions and configurations, according to the requirements of the customer.

First class materials, in compliance with relevant standards, are used in the production of the bedhead units and the products are offered to service using advanced installation techniques. The bedhead unit is a wall bedhead that integrates the supply of the medical gases, power, telephone and computer plugs etc..

It can be mounted either in single, double or triple bars, effectively separating the electricity cables and the gas pipes.

The user can choose the length of the units, select a color from the RAL chart, decide on the intensity of the lighting and choose the number and positioning of separate outlets.

Offering a sleek and elegant design combined with innovative features such as dual integrated accessory rails, integrated night light for easy access of services.

The shape of sockets for electrical and gas outlets is standardized and allows for installation of multiple types of outlets used in different countries, as well as different voltages.
